

Press release

Rewitec has achieved Germanischer Lloyd (GL) approval for Nanocoating Technology and is, to date, the only surface treatment for machinery to have Classification Society approval.

For 140 years Germanischer Lloyd (GL) has been offering its services to industry and setting standards in technology, safety and quality. GL is recognized by the marine and industry as a leading authority in its field, and its endorsement of Rewitec products comes at a time when machinery operators and reliability managers are rapidly recognizing the benefits of curing wear in their machinery.

GL approval of our Rewitec coating technology will assure operators of heavily loaded equipment of a higher protection against wear. It will also add value to the selling proposition of operators in the marine and industrial businesses, where Rewitec improves uptime of machinery and demonstrates a responsible attitude to the reliability of marine equipment and to the productivity of industrial processes.

Although achieving GL approval involves exhaustive and lengthy testing procedures, Rewitec already performed exhaustive validation at universities, research institutes, and leading industrial, marine, and automotive customers through many years since the patent in 2003. After a long process providing value documentation measures and after having successfully passed challenging tests, we are happy to confirm that Rewitec Coating deserves GL approval.
